## Benfield ${ }^{\circledR}$ Style Hand Bender

## How to Bend Guide

 960 Series BendersFor instructions in Spanish and French please visi Por favor, para instrucciones en Español y Francés visite Pour des instructions en espagnol et français, veuillez visiter www.gardnerbender.com

1. ARROW

Indicates start of bend. Use for stubs and saddle bends.
2. RIM NOTCH

Locates center of saddle bend.
3. STAR

Indicates the back of a $90^{\circ}$ bend
4. ANGLE ARROWS

Indicates the angle when bending on the floor. (sighting down the bender)
5. DEGREE SCALES

Indicates the angle when bending in the air. (sighting in-line with the conduit)
6. BEND BACK

Special channel designed for correcting overbends.
7. CONDUIT VISE Clamps conduit during cutting.

$90^{\circ}$ Bend

Rise or "Stub-ups"

Segment Bend

BENDING NOTES:
Thread handles into bender head as far as they will go.
BENDING ON THE FLOOR:
For best results keep the conduit pinned to the floor by applying constant pressure on the foot pedal throughout the entire bend.
BENDING IN THE AIR:
Tuck the conduit under your arm and use your foot to keep the handle from sliding on the floor. Keep your hands and body close to the bender throughout the bend.
CORRECTING OVER BENDS
There are two options for correcting over-bends. One option uses the open end of the handle as a "cheater" bar and the second uses the hook area.

## $90^{\circ}$ OR STUB BENDS:

## BENDING ON THE FLOOR

1. Measure stub height (x)
2. Subtract amount shown in chart from stub height. Deduct amount is also noted on bender (example: subtract 5" for a $1 / 2$ " bender)

| Conduit <br> Size | EMT <br> Deduct Amt. | RIGID/IMC <br> Deduct |
| :---: | :---: | :---: |
| $1 / 2^{\prime \prime}$ | $5^{\prime \prime}$ | $3^{3} / 4^{\prime \prime}$ |
| $3 / 4^{\prime \prime}$ | $6^{\prime \prime}$ | $7 "$ |
| $1^{\prime \prime}$ | $8^{\prime \prime}$ | $38^{1 / 2 "}$ |

3. Mark conduit at final deduct location.
4. Line up mark on conduit with arrow on bender. Make the bend.

BACK TO BACK BENDS:

1. Measure and mark distance on the conduit from a fixed point ( x ) to the back of the $90^{\circ}$ bend $(\mathrm{Y})$.
2. Align the mark $(\mathrm{Y})$ on the conduit with the star $\boldsymbol{x}$ on the bender and make the bend.

## SADDLE BENDS:

This bend is used to avoid an obstruction such as a pipe. The most common bend is a $45^{\circ}$ center bend and two $22^{1 / 2^{\circ}}$ outer bends. Another method of making a saddle bend is a $60^{\circ}$ center bend and two $30^{\circ}$.

1. Measure the height/diameter (D) of the object to be crossed over.
2. Measure the distance ( L ) to the object to be crossed over and add $3 / 16$ " to the length for each inch of the object height.
3. Mark this distance (C) on the conduit It is the center point.
4. Make the outer bend marks ( $X$ and $Y$ ) at a distance of $2^{1} / 2^{\prime \prime} \times$ the object size. Mark each from the center mark.
5. Align the center mark (C) with the "notch" on the bender and make a $45^{\circ}$ bend.
6. Align the outer marks ( $X$ and $Y$ ) with the arrow and make a $22^{1} / 2^{\circ}$ bend. $\begin{array}{ccc} & \text { Move Center } & \text { Make Outside Mark } \\ \text { Obstruction } & \begin{array}{c}\text { Mark Ahead } \\ \text { Height }\end{array} & \begin{array}{c}\text { Distance }\end{array} \\ \text { From Center Mark } \\ \text { Distance }\end{array}$

## OFFSET BENDS:

Offset bends are most commonly used to feed into a panel box or to go around an obstruction. The most common offset angle is $30^{\circ}$ due to the angle multiplier $=2$.

1. Measure the height of offset ( $Z$ ).
2. Measure the distance to obstruction (L) and add shrink amount (chart below) for each inch of offset. Mark the distance on the conduit (X).
3. Using the offset height $(Z)$ times angle multiplier (chart below) subtract this amount from the 1st mark and mark this on the conduit ( X )
4. Align the marks with the arrow and make your bends.

| Angle <br> of Bend | Constant <br> Multiplier | Shrinkage / Inch <br> of Offset Depth |
| :---: | :---: | :---: |
| $10^{\prime \prime}$ | $6.0^{\prime \prime}$ | $1 / 16^{\prime \prime}$ |
| $21^{1 / 2 "}$ | $2.6^{\prime \prime}$ | $3 / 16^{\prime \prime}$ |
| $30 "$ | $2.0^{\prime \prime}$ | $1 / 4^{\prime \prime}$ |
| $45^{\prime \prime}$ | $1.4^{\prime \prime}$ | $3 / 8^{\prime \prime}$ |
| $60^{\prime \prime}$ | $1.2^{\prime \prime}$ | $1 / 2^{\prime \prime}$ |
